Entanglement of completely symmetric quantum states

Hans Maassen, Radboud University Nijmegen, the Netherlands

QP-NCG-QI, Edinburgh January 18, 2012.

Collaboration with Burkhard Kümmerer and Bram Petri

We consider a quantum system consisting of n identical, but distinguishable subsystems ("particles") described by Hilbert spaces of dimension d.

We consider a quantum system consisting of n identical, but distinguishable subsystems ("particles") described by Hilbert spaces of dimension d.

A state on such a system is called completely symmetric if it is symmetric both for the global rotation of all the individual Hilbert spaces together ("Werner state") and for permutations of the particles.

We consider a quantum system consisting of n identical, but distinguishable subsystems ("particles") described by Hilbert spaces of dimension d.

A state on such a system is called completely symmetric if it is symmetric both for the global rotation of all the individual Hilbert spaces together ("Werner state") and for permutations of the particles.

The state is called entangled if it can not be written as a convex combination of product states.

We consider a quantum system consisting of n identical, but distinguishable subsystems ("particles") described by Hilbert spaces of dimension d.

A state on such a system is called completely symmetric if it is symmetric both for the global rotation of all the individual Hilbert spaces together ("Werner state") and for permutations of the particles.

The state is called entangled if it can not be written as a convex combination of product states.

For a given completely symmetric state, we want to find out if it is entangled or not, and, if so, to quantify how entangled it is.

Entanglement is a central issue in quantum information theory.

Entanglement is a central issue in quantum information theory.

The study of *n* party-entanglement is considered difficult. It is complicated by the fact that the state space of *n* systems of size *d* has a large dimension: $d^{2n} - 1$.

Entanglement is a central issue in quantum information theory.

The study of *n* party-entanglement is considered difficult. It is complicated by the fact that the state space of *n* systems of size *d* has a large dimension: $d^{2n} - 1$.

The number of parameters is greatly reduced by requiring the state to be completely symmetric. The dimension d drops out entirely, and the number of parameters becomes (one less than) the number of possible partitions of the n particles.

Entanglement is a central issue in quantum information theory.

The study of *n* party-entanglement is considered difficult. It is complicated by the fact that the state space of *n* systems of size *d* has a large dimension: $d^{2n} - 1$.

The number of parameters is greatly reduced by requiring the state to be completely symmetric. The dimension d drops out entirely, and the number of parameters becomes (one less than) the number of possible partitions of the n particles.

For example, for 2 quantum identical systems of arbitrary size d there is only one parameter.

The number of parameters is greatly reduced by requiring the state to be completely symmetric. The dimension d drops out entirely, and the number of parameters becomes (one less than) the number of possible partitions of the n particles.

For example, for 2 quantum identical systems of arbitrary size d there is only one parameter.

An advantage of this restraint is that we can lean on a vast body of results from classical mathematics: the representation theory of S_n and SU(d), as pioneered by Frobenius, Schur, Weyl, Littlewood,

Entanglement is a central issue in quantum information theory.

The study of *n* party-entanglement is considered difficult. It is complicated by the fact that the state space of *n* systems of size *d* has a large dimension: $d^{2n} - 1$.

The number of parameters is greatly reduced by requiring the state to be completely symmetric. The dimension d drops out entirely, and the number of parameters becomes (one less than) the number of possible partitions of the n particles.

For example, for 2 quantum identical systems of arbitrary size d there is only one parameter.

An advantage of this restraint is that we can lean on a vast body of results from classical mathematics: the representation theory of S_n and SU(d), as pioneered by Frobenius, Schur, Weyl, Littlewood,

But also some recent work in pure mathematics turns out to be surprisingly relevant to our question.

Theorem

A Werner state ρ on $M_d \otimes M_d$ is separable iff

 $ho(F) \geq 0$.

For any pure product state $\psi \otimes \varphi \in \mathbb{C}^d \otimes \mathbb{C}^d$ the expectation of F is positive:

For any pure product state $\psi \otimes \varphi \in \mathbb{C}^d \otimes \mathbb{C}^d$ the expectation of *F* is positive:

 $\langle \psi \otimes \varphi, F(\psi \otimes \varphi) \rangle = \langle \psi \otimes \varphi, \varphi \otimes \psi \rangle = \langle \psi, \varphi \rangle \langle \varphi, \psi \rangle = |\langle \psi, \varphi \rangle|^2 \ge 0 \; .$

For any pure product state $\psi \otimes \varphi \in \mathbb{C}^d \otimes \mathbb{C}^d$ the expectation of F is positive:

$$\langle \psi \otimes \varphi, F(\psi \otimes \varphi)
angle = \langle \psi \otimes \varphi, \varphi \otimes \psi
angle = \langle \psi, \varphi
angle \langle \varphi, \psi
angle = |\langle \psi, \varphi
angle|^2 \ge \mathbf{0} \; .$$

The inequality extends to all separable states by convexity.

For any pure product state $\psi \otimes \varphi \in \mathbb{C}^d \otimes \mathbb{C}^d$ the expectation of F is positive:

$$\langle \psi \otimes \varphi, F(\psi \otimes \varphi)
angle = \langle \psi \otimes \varphi, \varphi \otimes \psi
angle = \langle \psi, \varphi
angle \langle \varphi, \psi
angle = |\langle \psi, \varphi
angle|^2 \ge \mathbf{0} \; .$$

The inequality extends to all separable states by convexity.

Conversely, suppose $0 \le \rho(F) \le 1$ for some Werner state ρ , and choose unit vectors ψ, φ with

$$|\langle \psi, \varphi \rangle|^2 =
ho(F)$$
 .

For any pure product state $\psi \otimes \varphi \in \mathbb{C}^d \otimes \mathbb{C}^d$ the expectation of F is positive:

$$\langle \psi \otimes \varphi, F(\psi \otimes \varphi)
angle = \langle \psi \otimes \varphi, \varphi \otimes \psi
angle = \langle \psi, \varphi
angle \langle \varphi, \psi
angle = |\langle \psi, \varphi
angle|^2 \ge \mathbf{0} \; .$$

The inequality extends to all separable states by convexity.

Conversely, suppose $0 \le \rho(F) \le 1$ for some Werner state ρ , and choose unit vectors ψ, φ with

$$|\langle \psi, arphi
angle|^2 =
ho(F)$$
 .

Then the separable state

$$\mathsf{x} \mapsto \big\langle \psi \otimes \varphi, \mathsf{P}(\mathsf{x})\psi \otimes \varphi \big\rangle = \int_{\mathsf{SU}(d)} \big\langle (\mathsf{u} \otimes \mathsf{u})\psi \otimes \varphi, \mathsf{x}(\mathsf{u} \otimes \mathsf{u})\psi \otimes \varphi \big\rangle \, d\mathsf{u}$$

is a Werner state, and coincides with ρ on F.

For any pure product state $\psi \otimes \varphi \in \mathbb{C}^d \otimes \mathbb{C}^d$ the expectation of F is positive:

$$\langle \psi \otimes \varphi, F(\psi \otimes \varphi)
angle = \langle \psi \otimes \varphi, \varphi \otimes \psi
angle = \langle \psi, \varphi
angle \langle \varphi, \psi
angle = |\langle \psi, \varphi
angle|^2 \ge \mathsf{0} \; .$$

The inequality extends to all separable states by convexity.

Conversely, suppose $0 \le \rho(F) \le 1$ for some Werner state ρ , and choose unit vectors ψ, φ with

$$|\langle \psi, arphi
angle|^2 =
ho(F)$$
 .

Then the separable state

$$x \mapsto \left\langle \psi \otimes \varphi, \mathsf{P}(x)\psi \otimes \varphi \right\rangle = \int_{\mathsf{SU}(d)} \left\langle (u \otimes u)\psi \otimes \varphi, x(u \otimes u)\psi \otimes \varphi \right\rangle du$$

is a Werner state, and coincides with ρ on F. Hence it equals ρ .

$$SU(d) \ni u \quad : \quad \pi'(u)\psi_1 \otimes \psi_2 \otimes \ldots \otimes \psi_n := u\psi_1 \otimes u\psi_2 \otimes \cdots \otimes u\psi_n$$

On the Hilbert space

$$\mathcal{H} := \mathbb{C}^d \otimes \mathbb{C}^d \otimes \cdots \mathbb{C}^d \qquad (n \text{ times})$$

there are representations of two groups: S_n and SU(d):

$$S_n \ni \sigma \quad : \quad \pi(\sigma)\psi_1 \otimes \psi_2 \otimes \ldots \otimes \psi_n := \psi_{\sigma^{-1}(1)} \otimes \psi_{\sigma^{-1}(2)} \otimes \cdots \otimes \psi_{\sigma^{-1}(n)}$$
$$SU(d) \ni u \quad : \quad \pi'(u)\psi_1 \otimes \psi_2 \otimes \ldots \otimes \psi_n := u\psi_1 \otimes u\psi_2 \otimes \cdots \otimes u\psi_n$$

The classical Schur-Weyl duality theorem states that these two group actions do not only commute, but the algebras they generate are actually each other's commutant.

On the Hilbert space

$$\mathcal{H} := \mathbb{C}^d \otimes \mathbb{C}^d \otimes \cdots \mathbb{C}^d \qquad (n \text{ times})$$

there are representations of two groups: S_n and SU(d):

$$S_n \ni \sigma \quad : \quad \pi(\sigma)\psi_1 \otimes \psi_2 \otimes \ldots \otimes \psi_n := \psi_{\sigma^{-1}(1)} \otimes \psi_{\sigma^{-1}(2)} \otimes \cdots \otimes \psi_{\sigma^{-1}(n)}$$
$$SU(d) \ni u \quad : \quad \pi'(u)\psi_1 \otimes \psi_2 \otimes \ldots \otimes \psi_n := u\psi_1 \otimes u\psi_2 \otimes \cdots \otimes u\psi_n$$

The classical Schur-Weyl duality theorem states that these two group actions do not only commute, but the algebras they generate are actually each other's commutant. In particular they have the same center:

$$\mathcal{Z} := \mathcal{Z}(n,d) := \pi(S_n)' \cap \pi'(SU(d))'$$
.
General $n \in \mathbb{N}$: Schur-Weyl duality

On the Hilbert space

$$\mathcal{H} := \mathbb{C}^d \otimes \mathbb{C}^d \otimes \cdots \mathbb{C}^d \qquad (n \text{ times})$$

there are representations of two groups: S_n and SU(d):

$$S_n \ni \sigma \quad : \quad \pi(\sigma)\psi_1 \otimes \psi_2 \otimes \ldots \otimes \psi_n := \psi_{\sigma^{-1}(1)} \otimes \psi_{\sigma^{-1}(2)} \otimes \cdots \otimes \psi_{\sigma^{-1}(n)}$$
$$SU(d) \ni u \quad : \quad \pi'(u)\psi_1 \otimes \psi_2 \otimes \ldots \otimes \psi_n := u\psi_1 \otimes u\psi_2 \otimes \cdots \otimes u\psi_n$$

The classical Schur-Weyl duality theorem states that these two group actions do not only commute, but the algebras they generate are actually each other's commutant. In particular they have the same center:

$$\mathcal{Z}:=\mathcal{Z}(n,d):=\pi(S_n)'\cap\pi'(SU(d))'$$
 .

The minimal projections in this center cut both group representations into their irreducible components, and they are labeled by Young diagrams.

General $n \in \mathbb{N}$: Schur-Weyl duality

On the Hilbert space

$$\mathcal{H} := \mathbb{C}^d \otimes \mathbb{C}^d \otimes \cdots \mathbb{C}^d \qquad (n \text{ times})$$

there are representations of two groups: S_n and SU(d):

$$S_n \ni \sigma \quad : \quad \pi(\sigma)\psi_1 \otimes \psi_2 \otimes \ldots \otimes \psi_n := \psi_{\sigma^{-1}(1)} \otimes \psi_{\sigma^{-1}(2)} \otimes \cdots \otimes \psi_{\sigma^{-1}(n)}$$
$$SU(d) \ni u \quad : \quad \pi'(u)\psi_1 \otimes \psi_2 \otimes \ldots \otimes \psi_n := u\psi_1 \otimes u\psi_2 \otimes \cdots \otimes u\psi_n$$

The classical Schur-Weyl duality theorem states that these two group actions do not only commute, but the algebras they generate are actually each other's commutant. In particular they have the same center:

$$\mathcal{Z}:=\mathcal{Z}(n,d):=\pi(\mathcal{S}_n)'\cap\pi'(\mathcal{SU}(d))'$$
 .

The minimal projections in this center cut both group representations into their irreducible components, and they are labeled by Young diagrams.

For example

$$\begin{array}{rcl} 3\otimes 3\otimes 3 &=& (10\otimes 1_+)\oplus (8\otimes 2)\oplus (1\otimes 1_-) \ . \\ &=& \blacksquare & \oplus & \blacksquare \end{array} \\ \end{array}$$

Let A_n denote the group algebra of S_n :

Let A_n denote the group algebra of S_n :

 $f:S_n
ightarrow \mathbb{C}$ to be viewed as $\sum_{\sigma\in S_n}f(\sigma)\sigma$.

Let A_n denote the group algebra of S_n :

 $f:S_n o \mathbb{C}$ to be viewed as

$$\sum_{\sigma\in S_n}f(\sigma)\sigma.$$

Multiplication in A_n is convolution:

$$(f * g)(\sigma) = \sum_{\tau \in S_n} f(\tau)g(\tau^{-1}\sigma).$$

Let A_n denote the group algebra of S_n :

 $f:S_n o \mathbb{C}$ to be viewed as

$$\sum_{\sigma\in S_n}f(\sigma)\sigma.$$

Multiplication in A_n is convolution:

$$(f * g)(\sigma) = \sum_{\tau \in S_n} f(\tau)g(\tau^{-1}\sigma).$$

The unit is δ_e , where *e* is the identity element of S_n .

$$f^*(\sigma) = \overline{f(\sigma^{-1})}$$
.

Every unitary representation of S_n automatically extends to a representation of A_n .

In our case

$$\pi(f): \quad \psi_1 \otimes \ldots \otimes \psi_n \mapsto \sum_{\sigma \in S_n} f(\sigma) \psi_{\sigma^{-1}(1)} \otimes \ldots \otimes \psi_{\sigma^{-1}n}.$$

We let $f \in A_n$ act on the Hilbert space $l^2(S_n)$ by convolution on the left:

 $h\mapsto f*h$.

We let $f \in A_n$ act on the Hilbert space $l^2(S_n)$ by convolution on the left:

 $h\mapsto f*h$.

The trace on this "Hilbert space" is of a particularly simple form:

$$\operatorname{tr}_{\operatorname{reg}}(f) := \sum_{\sigma \in S_n} \langle \delta_{\sigma}, f * \delta_{\sigma} \rangle = \sum_{\sigma \in S_n} (f * \delta_{\sigma})(\sigma) = n! \cdot f(e) ,$$

and will be called the regular trace.

We let $f \in A_n$ act on the Hilbert space $l^2(S_n)$ by convolution on the left:

 $h\mapsto f*h$.

The trace on this "Hilbert space" is of a particularly simple form:

$$\operatorname{tr}_{\operatorname{reg}}(f) := \sum_{\sigma \in S_n} \langle \delta_{\sigma}, f * \delta_{\sigma} \rangle = \sum_{\sigma \in S_n} (f * \delta_{\sigma})(\sigma) = n! \cdot f(e) ,$$

and will be called the regular trace.

The normalized version $\tau_{reg} := \frac{1}{n!} tr_{reg}$ is the regular trace state.

 $\mathcal{Z}_n := \mathcal{A}_n \cap \mathcal{A}'_n$.

 $\mathcal{Z}_n := \mathcal{A}_n \cap \mathcal{A}'_n$.

We have $f \in \mathcal{Z}_n$ if and only if for all $\sigma, \tau \in S_n$: $f(\sigma \tau) = f(\tau \sigma)$:

 $\mathcal{Z}_n := \mathcal{A}_n \cap \mathcal{A}'_n$.

We have $f \in \mathbb{Z}_n$ if and only if for all $\sigma, \tau \in S_n$: $f(\sigma \tau) = f(\tau \sigma)$: The center consists of the class functions.

 $\mathcal{Z}_n := \mathcal{A}_n \cap \mathcal{A}'_n$.

We have $f \in \mathbb{Z}_n$ if and only if for all $\sigma, \tau \in S_n$: $f(\sigma\tau) = f(\tau\sigma)$: The center consists of the class functions. Hence

 $\mathcal{Z}_n := \mathcal{A}_n \cap \mathcal{A}'_n$.

We have $f \in \mathbb{Z}_n$ if and only if for all $\sigma, \tau \in S_n$: $f(\sigma\tau) = f(\tau\sigma)$: The center consists of the class functions. Hence

dim $\mathcal{Z}_n = \#$ (conjugacy classes of S_n)

 $\mathcal{Z}_n := \mathcal{A}_n \cap \mathcal{A}'_n$.

We have $f \in \mathbb{Z}_n$ if and only if for all $\sigma, \tau \in S_n$: $f(\sigma\tau) = f(\tau\sigma)$: The center consists of the class functions. Hence

dim
$$Z_n = \#$$
(conjugacy classes of S_n)
= $\#$ (partitions of n) =: $\mathcal{P}(n)$.

 $\mathcal{Z}_n := \mathcal{A}_n \cap \mathcal{A}'_n$.

We have $f \in \mathbb{Z}_n$ if and only if for all $\sigma, \tau \in S_n$: $f(\sigma\tau) = f(\tau\sigma)$: The center consists of the class functions. Hence

$$\dim \mathcal{Z}_n = \#(\text{conjugacy classes of } S_n)$$
$$= \#(\text{partitions of } n) =: \mathcal{P}(n) .$$

On the other hand, since \mathcal{Z}_n is an abelian matrix algebra, it must be of the form

$$\mathcal{Z}_n = \bigoplus_{i=1}^{\mathcal{P}(n)} \mathbb{C} p_i$$

for some orthogonal set of minimal projections p_i in the center.

 $\mathcal{Z}_n := \mathcal{A}_n \cap \mathcal{A}'_n$.

We have $f \in \mathbb{Z}_n$ if and only if for all $\sigma, \tau \in S_n$: $f(\sigma\tau) = f(\tau\sigma)$: The center consists of the class functions. Hence

$$\dim \mathcal{Z}_n = \#(\text{conjugacy classes of } S_n)$$
$$= \#(\text{partitions of } n) =: \mathcal{P}(n) .$$

On the other hand, since \mathcal{Z}_n is an abelian matrix algebra, it must be of the form

$$\mathcal{Z}_n = \bigoplus_{i=1}^{\mathcal{P}(n)} \mathbb{C} p_i$$

for some orthogonal set of minimal projections p_i in the center. The states on the center form a simplex with extreme points ρ_i given by

$$\rho_i(p_j) = \delta_{ij}$$
.

The center \mathcal{Z}_n of the group algebra \mathcal{A}_n has dimension $\mathcal{P}(n)$.

The center \mathcal{Z}_n of the group algebra \mathcal{A}_n has dimension $\mathcal{P}(n)$. So it contains $\mathcal{P}(n)$ minimal projections $p_1, p_2, \ldots, p_{\mathcal{P}(n)}$:

$$p_i(\sigma^{-1}) = \overline{p_i(\sigma)}, \quad p_i * p_j = \delta_{ij}p_i \text{ and } \sum_{i=1}^{\mathcal{P}(n)} p_i = \delta_e.$$

The center \mathcal{Z}_n of the group algebra \mathcal{A}_n has dimension $\mathcal{P}(n)$. So it contains $\mathcal{P}(n)$ minimal projections $p_1, p_2, \ldots, p_{\mathcal{P}(n)}$:

$$p_i(\sigma^{-1}) = \overline{p_i(\sigma)}, \quad p_i * p_j = \delta_{ij}p_i \text{ and } \sum_{i=1}^{\mathcal{P}(n)} p_i = \delta_e.$$

They cut the algebra $\mathcal{A} = \mathcal{A}_n$ into factors $p_i \mathcal{A}$:

$$\mathcal{A} = \bigoplus_{i=1}^{\mathcal{P}(n)} p_i \mathcal{A} \simeq \bigoplus_{i=1}^{\mathcal{P}(n)} M_{d(i)}$$

The center \mathcal{Z}_n of the group algebra \mathcal{A}_n has dimension $\mathcal{P}(n)$. So it contains $\mathcal{P}(n)$ minimal projections $p_1, p_2, \ldots, p_{\mathcal{P}(n)}$:

$$p_i(\sigma^{-1}) = \overline{p_i(\sigma)}, \quad p_i * p_j = \delta_{ij}p_i \text{ and } \sum_{i=1}^{\mathcal{P}(n)} p_i = \delta_e.$$

They cut the algebra $\mathcal{A} = \mathcal{A}_n$ into factors $p_i \mathcal{A}$:

$$\mathcal{A} = \bigoplus_{i=1}^{\mathcal{P}(n)} p_i \mathcal{A} \simeq \bigoplus_{i=1}^{\mathcal{P}(n)} M_{d(i)}$$

Hence

$$d(i)^2 = \operatorname{tr}(p_i) = n! \cdot p_i(e)$$

The center \mathcal{Z}_n of the group algebra \mathcal{A}_n has dimension $\mathcal{P}(n)$. So it contains $\mathcal{P}(n)$ minimal projections $p_1, p_2, \ldots, p_{\mathcal{P}(n)}$:

$$p_i(\sigma^{-1}) = \overline{p_i(\sigma)}, \quad p_i * p_j = \delta_{ij}p_i \text{ and } \sum_{i=1}^{\mathcal{P}(n)} p_i = \delta_e.$$

They cut the algebra $\mathcal{A} = \mathcal{A}_n$ into factors $p_i \mathcal{A}$:

$$\mathcal{A} = \bigoplus_{i=1}^{\mathcal{P}(n)} p_i \mathcal{A} \simeq \bigoplus_{i=1}^{\mathcal{P}(n)} M_{d(i)}$$

Hence

$$d(i)^2 = \operatorname{tr}(p_i) = n! \cdot p_i(e) .$$

Now define the character $\chi_i : S_n \to \mathbb{C}$ by:

$$\chi_i(\sigma) := \frac{n!}{d(i)} p_i(\sigma) .$$

The center \mathcal{Z}_n of the group algebra \mathcal{A}_n has dimension $\mathcal{P}(n)$. So it contains $\mathcal{P}(n)$ minimal projections $p_1, p_2, \ldots, p_{\mathcal{P}(n)}$:

$$p_i(\sigma^{-1}) = \overline{p_i(\sigma)}, \quad p_i * p_j = \delta_{ij}p_i \text{ and } \sum_{i=1}^{\mathcal{P}(n)} p_i = \delta_e.$$

They cut the algebra $\mathcal{A} = \mathcal{A}_n$ into factors $p_i \mathcal{A}$:

$$\mathcal{A} = \bigoplus_{i=1}^{\mathcal{P}(n)} p_i \mathcal{A} \simeq \bigoplus_{i=1}^{\mathcal{P}(n)} M_{d(i)}$$

Hence

$$d(i)^2 = \operatorname{tr}(p_i) = n! \cdot p_i(e) .$$

Now define the character $\chi_i : S_n \to \mathbb{C}$ by:

$$\chi_i(\sigma) := \frac{n!}{d(i)} p_i(\sigma) .$$

Then these functions form an orthonormal set in the sense that

$$\langle \chi_i, \chi_j \rangle = \sum_{\sigma} \overline{\chi_i(\sigma)} \chi_j(\sigma) = \frac{(n!)^2}{d(i)d(j)} p_i * p_j(e) = \frac{n!}{d(i)^2} \cdot n! p_i(e) \delta_{ij} = n! \cdot \delta_{ij}.$$

Lemma

The character $\chi_i(\sigma)$ is the trace of σ in its irreducible representation labelled by *i*.

Lemma

The character $\chi_i(\sigma)$ is the trace of σ in its irreducible representation labelled by *i*.

Proof.

Lemma

The character $\chi_i(\sigma)$ is the trace of σ in its irreducible representation labelled by *i*.

Proof.

The space $p_i \mathcal{H}_{reg}$ looks like $M_{d(i)} \simeq \mathbb{C}^{d(i)} \otimes \mathbb{C}^{d(i)}$.

Lemma

The character $\chi_i(\sigma)$ is the trace of σ in its irreducible representation labelled by *i*.

Proof.

The space $p_i \mathcal{H}_{\text{reg}}$ looks like $M_{d(i)} \simeq \mathbb{C}^{d(i)} \otimes \mathbb{C}^{d(i)}$.

On this space ${\mathcal A}$ and its commutant ${\mathcal A}'$ act as

 $p_i \mathcal{A} \simeq M_{d(i)} \otimes \mathbb{1}$ and $p_i(\mathcal{A}') \simeq \mathbb{1} \otimes M_{d(i)}$.

Lemma

The character $\chi_i(\sigma)$ is the trace of σ in its irreducible representation labelled by *i*.

Proof.

The space $p_i \mathcal{H}_{reg}$ looks like $M_{d(i)} \simeq \mathbb{C}^{d(i)} \otimes \mathbb{C}^{d(i)}$. On this space \mathcal{A} and its commutant \mathcal{A}' act as

$$p_i \mathcal{A} \simeq M_{d(i)} \otimes \mathbb{1}$$
 and $p_i(\mathcal{A}') \simeq \mathbb{1} \otimes M_{d(i)}$.

Let us now choose a minimal projection $q_i \in p_i(\mathcal{A}')$.
Interpretation of the characters χ_i

Lemma

The character $\chi_i(\sigma)$ is the trace of σ in its irreducible representation labelled by *i*.

Proof.

The space $p_i \mathcal{H}_{reg}$ looks like $M_{d(i)} \simeq \mathbb{C}^{d(i)} \otimes \mathbb{C}^{d(i)}$. On this space \mathcal{A} and its commutant \mathcal{A}' act as

$$p_i \mathcal{A} \simeq M_{d(i)} \otimes \mathbb{1}$$
 and $p_i(\mathcal{A}') \simeq \mathbb{1} \otimes M_{d(i)}$.

Let us now choose a minimal projection $q_i \in p_i(\mathcal{A}')$.

Then the regular representation acts irredicibly on the range of $p_i q_i$.

Interpretation of the characters χ_i

Lemma

The character $\chi_i(\sigma)$ is the trace of σ in its irreducible representation labelled by *i*.

Proof.

The space $p_i \mathcal{H}_{reg}$ looks like $M_{d(i)} \simeq \mathbb{C}^{d(i)} \otimes \mathbb{C}^{d(i)}$. On this space \mathcal{A} and its commutant \mathcal{A}' act as

$$p_i \mathcal{A} \simeq M_{d(i)} \otimes \mathbb{1}$$

Let us now choose a minimal projection $q_i \in p_i(\mathcal{A}')$.

Then the regular representation acts irredicibly on the range of $p_i q_i$. Now, in the regular representation we may calculate

$$\chi_i(\sigma) = \frac{n!}{d(i)} p_i(\sigma) = \frac{1}{d(i)} n! (p_i * \delta_\sigma)(e) = \frac{1}{d(i)} \operatorname{tr}_{\operatorname{reg}}(p_i * \delta_\sigma) = \operatorname{tr}_{\operatorname{reg}}(p_i * q_i * \delta_\sigma) ,$$

The irreducible representations of S_n (and hence also the minimal central projections and the characters) are labelled by Young frames with n boxes:

The irreducible representations of S_n (and hence also the minimal central projections and the characters) are labelled by Young frames with n boxes:

(Hook length rule)

$$d(Y) = rac{n!}{\prod ext{hook lengths}}$$
 .

The irreducible representations of S_n (and hence also the minimal central projections and the characters) are labelled by Young frames with n boxes:

(Hook length rule)

$$d(Y) = \frac{n!}{\prod \text{hook lengths}}$$

For example:

$$d\left(\boxed{} \right) = \frac{5!}{4 \times 3 \times 2} = 5$$
 hook lengths:

Theorem Let $n, d \in \mathbb{N}$. Let Y denote a Young frame with n boxes and height h(Y). Then

 $\pi_{n,d}(p_Y) = 0$ iff h(Y) > d.

Theorem

Let $n, d \in \mathbb{N}$. Let Y denote a Young frame with n boxes and height h(Y). Then

$$\pi_{n,d}(p_Y) = 0 \quad iff \quad h(Y) > d \; .$$

Proof.

This can be shown using the explicit representation of p_Y ; see, for example, B. Simon: '*Representations of finite and compact groups*'.

Theorem

Let $n, d \in \mathbb{N}$. Let Y denote a Young frame with n boxes and height h(Y). Then

$$\pi_{n,d}(p_Y) = 0 \quad iff \quad h(Y) > d \; .$$

Proof.

This can be shown using the explicit representation of p_Y ; see, for example, B. Simon: *'Representations of finite and compact groups'*.

For example, the symmetric subspace, having Young frame $\square \square$, is nonzero in $(\mathbb{C}^d)^{\otimes 4}$ for every one-particle dimension d, but, according to Pauli's exclusion principle, the antisymmetric subspace, with Young frame \square , needs $d \ge 4$.

Theorem

Let $n, d \in \mathbb{N}$. Let Y denote a Young frame with n boxes and height h(Y). Then

$$\pi_{n,d}(p_Y) = 0 \quad iff \quad h(Y) > d \; .$$

Proof.

This can be shown using the explicit representation of p_Y ; see, for example, B. Simon: *'Representations of finite and compact groups'*.

For example, the symmetric subspace, having Young frame $\square \square$, is nonzero in $(\mathbb{C}^d)^{\otimes 4}$ for every one-particle dimension d, but, according to Pauli's exclusion principle, the antisymmetric subspace, with Young frame \square , needs $d \ge 4$. Hence the above theorem generalizes this exclusion principle.

Observables (operators) on $\mathcal{H} := \mathbb{C}^d \otimes \ldots \otimes \mathbb{C}^d$ can be 'twirled' and averaged:

$$Ta := \int_{SU(d)} (u \otimes \ldots \otimes u)^* a (u \otimes \ldots \otimes u) du;$$

$$Ma := \frac{1}{n!} \sum_{\sigma \in S_n} \pi(\sigma) a \pi(\sigma).$$

Observables (operators) on $\mathcal{H} := \mathbb{C}^d \otimes \ldots \otimes \mathbb{C}^d$ can be 'twirled' and averaged:

$$Ta := \int_{SU(d)} (u \otimes \ldots \otimes u)^* a (u \otimes \ldots \otimes u) du;$$

$$Ma := \frac{1}{n!} \sum_{\sigma \in S_n} \pi(\sigma) a \pi(\sigma).$$

Clearly, $Ta \in \pi'(SU(d))'$, and in the same way $Ma \in \pi(S_n)'$.

Observables (operators) on $\mathcal{H} := \mathbb{C}^d \otimes \ldots \otimes \mathbb{C}^d$ can be 'twirled' and averaged:

$$Ta := \int_{SU(d)} (u \otimes \ldots \otimes u)^* a (u \otimes \ldots \otimes u) du;$$

$$Ma := \frac{1}{n!} \sum_{\sigma \in S_n} \pi(\sigma) a \pi(\sigma).$$

Clearly, $Ta \in \pi'(SU(d))'$, and in the same way $Ma \in \pi(S_n)'$. Hence P := TM = MT projects onto the center $\pi(\mathcal{Z}_n)$,

Observables (operators) on $\mathcal{H} := \mathbb{C}^d \otimes \ldots \otimes \mathbb{C}^d$ can be 'twirled' and averaged:

$$Ta := \int_{SU(d)} (u \otimes \ldots \otimes u)^* a (u \otimes \ldots \otimes u) du;$$

$$Ma := \frac{1}{n!} \sum_{\sigma \in S_n} \pi(\sigma) a \pi(\sigma).$$

Clearly, $Ta \in \pi'(SU(d))'$, and in the same way $Ma \in \pi(S_n)'$. Hence P := TM = MT projects onto the center $\pi(\mathcal{Z}_n)$, Dually P^* takes a state ϑ , restricts it to the center, and then extends it to a completely symmetric state on $\mathcal{B}(\mathcal{H})$:

$$(P^*\vartheta)(a):=\vartheta(Pa)$$
.

Observables (operators) on $\mathcal{H} := \mathbb{C}^d \otimes \ldots \otimes \mathbb{C}^d$ can be 'twirled' and averaged:

$$Ta := \int_{SU(d)} (u \otimes \ldots \otimes u)^* a (u \otimes \ldots \otimes u) du;$$

$$Ma := \frac{1}{n!} \sum_{\sigma \in S_n} \pi(\sigma) a \pi(\sigma).$$

Clearly, $Ta \in \pi'(SU(d))'$, and in the same way $Ma \in \pi(S_n)'$. Hence P := TM = MT projects onto the center $\pi(\mathcal{Z}_n)$, Dually P^* takes a state ϑ , restricts it to the center, and then extends it to a completely symmetric state on $\mathcal{B}(\mathcal{H})$:

$$(P^*\vartheta)(a) := \vartheta(Pa)$$
.

Theorem (Separability of completely symmetric states)

Let ϑ be a completely symmetric state on $\mathcal{B}((\mathbb{C}^d)^{\otimes n})$. Then ϑ is separable iff its restriction to \mathcal{Z} lies in the convex hull of the restricted product states.

Observables (operators) on $\mathcal{H} := \mathbb{C}^d \otimes \ldots \otimes \mathbb{C}^d$ can be 'twirled' and averaged:

$$Ta := \int_{SU(d)} (u \otimes \ldots \otimes u)^* a (u \otimes \ldots \otimes u) du;$$

$$Ma := \frac{1}{n!} \sum_{\sigma \in S_n} \pi(\sigma) a \pi(\sigma).$$

Clearly, $Ta \in \pi'(SU(d))'$, and in the same way $Ma \in \pi(S_n)'$. Hence P := TM = MT projects onto the center $\pi(\mathcal{Z}_n)$, Dually P^* takes a state ϑ , restricts it to the center, and then extends it to a completely symmetric state on $\mathcal{B}(\mathcal{H})$:

$$(P^*\vartheta)(a) := \vartheta(Pa)$$
.

Theorem (Separability of completely symmetric states)

Let ϑ be a completely symmetric state on $\mathcal{B}((\mathbb{C}^d)^{\otimes n})$. Then ϑ is separable iff its restriction to \mathcal{Z} lies in the convex hull of the restricted product states.

Conclusion: We must calculate the shadow of the product states!

If ϑ is separable, then it is a convex combination of product states, so its restriction to \mathcal{Z} is a convex combination of such restrictions.

If ϑ is separable, then it is a convex combination of product states, so its restriction to \mathcal{Z} is a convex combination of such restrictions. Conversely, if for all $z \in \mathcal{Z}$ we have

$$artheta(z) = \sum_i \mu_i \langle \psi_i, z \psi_i
angle \; ,$$

for some positive weights μ_i with sum 1 and unit product vectors ψ_i ,

If ϑ is separable, then it is a convex combination of product states, so its restriction to \mathcal{Z} is a convex combination of such restrictions. Conversely, if for all $z \in \mathcal{Z}$ we have

$$artheta(z) = \sum_i \mu_i \langle \psi_i, z \psi_i
angle \; ,$$

for some positive weights μ_i with sum 1 and unit product vectors ψ_i , then since ϑ is completely symmetric, we have for all $x \in \mathcal{B}(\mathcal{H})$,

$$\begin{split} \vartheta(\mathbf{x}) &= \vartheta(\mathbf{P}\mathbf{x}) = \sum_{i} \mu_{i} \langle \psi_{i}, \mathbf{P}\mathbf{x}\psi_{i} \rangle \\ &= \frac{1}{n!} \sum_{i} \sum_{\sigma \in S_{n}} \int_{SU(d)} \mu_{i} \langle \pi(\sigma)(\mathbf{u} \otimes \ldots \otimes \mathbf{u})\psi_{i}, \mathbf{x} \pi(\sigma)(\mathbf{u} \otimes \ldots \otimes \mathbf{u})\psi_{i} \rangle \, d\mathbf{u} \; , \end{split}$$

which is a convex inegral of product states, hence separable.

Theorem

The strace state moves towards the regular trace as $d \to \infty$.

Theorem

The strace state moves towards the regular trace as $d \to \infty$.

Proof. First we calculate:

Theorem

The strace state moves towards the regular trace as $d \to \infty$.

Proof.

First we calculate:

$$\begin{split} \mathrm{tr}_{d}^{\otimes n}(\pi(\sigma)) &= \sum_{i_{1}=1}^{d} \cdots \sum_{i_{n}=1}^{d} \langle e_{i_{1}} \otimes \cdots \otimes e_{i_{n}}, \pi(\sigma) \, e_{i_{1}} \otimes \cdots \otimes e_{i_{n}} \rangle \\ &= \sum_{i_{1}=1}^{d} \cdots \sum_{i_{n}=1}^{d} \delta_{i_{1}i_{\sigma}-1(1)} \cdots \delta_{i_{n}i_{\sigma}-1(n)} \, . \\ &= d^{\#(\mathrm{cycles of } \sigma)} \, . \end{split}$$

Theorem

The strace state moves towards the regular trace as $d \to \infty$.

Proof.

First we calculate:

$$\begin{split} \mathrm{tr}_{d}^{\otimes n}(\pi(\sigma)) &= \sum_{i_{1}=1}^{d} \cdots \sum_{i_{n}=1}^{d} \langle e_{i_{1}} \otimes \cdots \otimes e_{i_{n}}, \pi(\sigma) \, e_{i_{1}} \otimes \cdots \otimes e_{i_{n}} \rangle \\ &= \sum_{i_{1}=1}^{d} \cdots \sum_{i_{n}=1}^{d} \delta_{i_{1}i_{\sigma^{-1}(1)}} \cdots \delta_{i_{n}i_{\sigma^{-1}(n)}} \, . \\ &= d^{\#(\mathrm{cycles of } \sigma)} \, . \end{split}$$

since for every cycle one summation variable remains.

Theorem

The strace state moves towards the regular trace as $d \to \infty$.

Proof.

First we calculate:

$$\begin{split} \mathrm{tr}_{d}^{\otimes n}(\pi(\sigma)) &= \sum_{i_{1}=1}^{d} \cdots \sum_{i_{n}=1}^{d} \langle e_{i_{1}} \otimes \cdots \otimes e_{i_{n}}, \pi(\sigma) \, e_{i_{1}} \otimes \cdots \otimes e_{i_{n}} \rangle \\ &= \sum_{i_{1}=1}^{d} \cdots \sum_{i_{n}=1}^{d} \delta_{i_{1}i_{\sigma^{-1}(1)}} \cdots \delta_{i_{n}i_{\sigma^{-1}(n)}} \, . \\ &= d^{\#(\mathrm{cycles of } \sigma)} \, . \end{split}$$

since for every cycle one summation variable remains. Hence:

Theorem

The strace state moves towards the regular trace as $d \to \infty$.

Proof.

First we calculate:

$$\begin{split} \mathrm{tr}_{d}^{\otimes n}(\pi(\sigma)) &= \sum_{i_{1}=1}^{d} \cdots \sum_{i_{n}=1}^{d} \langle e_{i_{1}} \otimes \cdots \otimes e_{i_{n}}, \pi(\sigma) \, e_{i_{1}} \otimes \cdots \otimes e_{i_{n}} \rangle \\ &= \sum_{i_{1}=1}^{d} \cdots \sum_{i_{n}=1}^{d} \delta_{i_{1}i_{\sigma^{-1}(1)}} \cdots \delta_{i_{n}i_{\sigma^{-1}(n)}} \, . \\ &= d^{\#(\mathrm{cycles of } \sigma)} \, . \end{split}$$

since for every cycle one summation variable remains. Hence:

$$\tau_d^{\otimes n}(p_y) = \frac{d(Y)}{n!} \sum_{\sigma \in S_n} \chi_Y(\sigma) \frac{1}{d^n} \operatorname{tr}_d^{\otimes n}(\pi(\sigma)) \to \frac{d(Y)^2}{n!} , \qquad (d \to \infty) .$$

The state space $\mathcal{S}(\mathcal{Z})$ of the center \mathcal{Z} is a simplex whose corners are the states

 $\rho_Y : p_{Y'} \mapsto \delta_{YY'}$.

The state space $\mathcal{S}(\mathcal{Z})$ of the center \mathcal{Z} is a simplex whose corners are the states

 $\rho_Y : p_{Y'} \mapsto \delta_{YY'}$.

The product states throw their shadow on this simplex:

The state space $\mathcal{S}(\mathcal{Z})$ of the center \mathcal{Z} is a simplex whose corners are the states

 $\rho_Y : p_{Y'} \mapsto \delta_{YY'}$.

The product states throw their shadow on this simplex: the affine components of the product state $\psi_1 \otimes \ldots \otimes \psi_n$ are the weights

 $w_{\psi}(Y) := \langle \psi_1 \otimes \ldots \otimes \psi_n, \pi(p_Y) \psi_1 \otimes \ldots \otimes \psi_n \rangle$.

The state space $\mathcal{S}(\mathcal{Z})$ of the center \mathcal{Z} is a simplex whose corners are the states

 $\rho_Y : \quad p_{Y'} \mapsto \delta_{YY'} \; .$

The product states throw their shadow on this simplex: the affine components of the product state $\psi_1 \otimes \ldots \otimes \psi_n$ are the weights

$$w_{\psi}(Y) := \langle \psi_1 \otimes \ldots \otimes \psi_n, \pi(p_Y) \psi_1 \otimes \ldots \otimes \psi_n \rangle.$$

We note that the the regular trace has the following weights:

$$w_{\operatorname{reg}}(Y) := \tau_{\operatorname{reg}}(p_Y) = \frac{d(Y)^2}{n!}$$
.

The state space $\mathcal{S}(\mathcal{Z})$ of the center \mathcal{Z} is a simplex whose corners are the states

 $\rho_Y : \quad p_{Y'} \mapsto \delta_{YY'} \; .$

The product states throw their shadow on this simplex: the affine components of the product state $\psi_1 \otimes \ldots \otimes \psi_n$ are the weights

$$w_{\psi}(Y) := \langle \psi_1 \otimes \ldots \otimes \psi_n, \pi(p_Y) \psi_1 \otimes \ldots \otimes \psi_n \rangle.$$

We note that the the regular trace has the following weights:

$$w_{\operatorname{reg}}(Y) := \tau_{\operatorname{reg}}(p_Y) = \frac{d(Y)^2}{n!}$$

Now here's our basic connection between entanglement and classical mathematics:

The state space $\mathcal{S}(\mathcal{Z})$ of the center \mathcal{Z} is a simplex whose corners are the states

 $\rho_Y : p_{Y'} \mapsto \delta_{YY'}$.

The product states throw their shadow on this simplex: the affine components of the product state $\psi_1 \otimes \ldots \otimes \psi_n$ are the weights

$$w_{\psi}(Y) := \langle \psi_1 \otimes \ldots \otimes \psi_n, \pi(p_Y) \psi_1 \otimes \ldots \otimes \psi_n \rangle.$$

We note that the the regular trace has the following weights:

$$w_{\operatorname{reg}}(Y) := \tau_{\operatorname{reg}}(p_Y) = \frac{d(Y)^2}{n!}$$

Now here's our basic connection between entanglement and classical mathematics:

Theorem

The density of a product state $\psi_1 \otimes \ldots \otimes \psi_n$ with respect to the regular trace is the normalized immanant of the Gram matrix of $\psi_1, \psi_2, \ldots, \psi_n$.
Let A be an $n \times n$ matrix, and let Y be a Young frame with n boxes.

Let A be an $n \times n$ matrix, and let Y be a Young frame with n boxes. Then the immanant $Imm_Y(A)$ of this matrix associated to Y is defined as

$$\operatorname{Imm}_{Y}(A) := \sum_{\sigma \in S_{n}} \chi_{Y}(\sigma) \, a_{1\sigma(1)} a_{2\sigma(2)} \cdots a_{n\sigma(n)} \, .$$

Let A be an $n \times n$ matrix, and let Y be a Young frame with n boxes. Then the immanant $Imm_Y(A)$ of this matrix associated to Y is defined as

$$\operatorname{Imm}_{Y}(A) := \sum_{\sigma \in S_{n}} \chi_{Y}(\sigma) a_{1\sigma(1)} a_{2\sigma(2)} \cdots a_{n\sigma(n)}$$

The normalized immanant $\tilde{I}mm_Y(A)$ is defined so as to have $\tilde{I}mm(\mathbb{1}) = 1$:

$$\tilde{\operatorname{Imm}}_{Y}(A) := rac{\operatorname{Imm}_{Y}(A)}{d(Y)}$$
.

Let A be an $n \times n$ matrix, and let Y be a Young frame with n boxes. Then the immanant $Imm_Y(A)$ of this matrix associated to Y is defined as

$$\operatorname{Imm}_{Y}(A) := \sum_{\sigma \in S_{n}} \chi_{Y}(\sigma) a_{1\sigma(1)} a_{2\sigma(2)} \cdots a_{n\sigma(n)}.$$

The normalized immanant $\tilde{I}mm_Y(A)$ is defined so as to have $\tilde{I}mm(1) = 1$:

$$ilde{\mathrm{Imm}}_Y(A) := rac{\mathrm{Imm}_Y(A)}{d(Y)}$$
 .

Note the following well-known special cases:

$$\operatorname{Imm}_{(A)} = \det(A) \quad \text{and} \quad \operatorname{Imm}_{(A)} = \operatorname{per}(A) = \operatorname{per}(A) .$$

Let A be an $n \times n$ matrix, and let Y be a Young frame with n boxes. Then the immanant $Imm_Y(A)$ of this matrix associated to Y is defined as

$$\operatorname{Imm}_{Y}(A) := \sum_{\sigma \in S_{n}} \chi_{Y}(\sigma) a_{1\sigma(1)} a_{2\sigma(2)} \cdots a_{n\sigma(n)}.$$

The normalized immanant $\tilde{I}mm_Y(A)$ is defined so as to have $\tilde{I}mm(1) = 1$:

$$ilde{\mathrm{Imm}}_Y(A) := rac{\mathrm{Imm}_Y(A)}{d(Y)}$$

Note the following well-known special cases:

$$\operatorname{Imm}_{\square}(A) = \det(A) \quad \text{and} \quad \operatorname{Imm}_{\square}(A) = \operatorname{per}(A) \ .$$

We mention the following inequalities: for all positive definite matrices A and all Young frames Y:

$$det(A) \leq \tilde{I}mm_Y(A) \leq per(A)$$
.

Let A be an $n \times n$ matrix, and let Y be a Young frame with n boxes. Then the immanant $Imm_Y(A)$ of this matrix associated to Y is defined as

$$\operatorname{Imm}_{Y}(A) := \sum_{\sigma \in S_{n}} \chi_{Y}(\sigma) a_{1\sigma(1)} a_{2\sigma(2)} \cdots a_{n\sigma(n)}.$$

The normalized immanant $\tilde{I}mm_Y(A)$ is defined so as to have $\tilde{I}mm(1) = 1$:

$$\widetilde{\mathrm{Imm}}_{Y}(A) := rac{\mathrm{Imm}_{Y}(A)}{d(Y)}$$

Note the following well-known special cases:

$$\operatorname{Imm}_{(A)} = \det(A) \quad \text{and} \quad \operatorname{Imm}_{(A)} = \operatorname{per}(A) = \operatorname{per}(A) .$$

We mention the following inequalities: for all positive definite matrices A and all Young frames Y:

$$\det(A) \leq \widetilde{\operatorname{Imm}}_Y(A) \leq \operatorname{per}(A)$$
.

The first inequality was proved by Schur in 1918, the second was conjectured by Elliott Lieb in 1967, and is still open!

Proof.
Theorem

Only the state $\rho_+ = \rho_{\square \square \square \square \square}$ (n boxes) is separable, all other extremal states ρ_Y on $\mathcal{Z}_{n,d}$ are entangled.

Proof. Choose $\vartheta \in \mathbb{C}^d$.

Theorem

Only the state $\rho_+ = \rho_{\square\square\square\square}$ (n boxes) is separable, all other extremal states ρ_Y on $\mathcal{Z}_{n,d}$ are entangled.

Proof.

Choose $\vartheta \in \mathbb{C}^d$. Since $\vartheta \otimes \ldots \otimes \vartheta \in \mathcal{H}_+$, we have $\langle \vartheta \otimes \ldots \otimes \vartheta, p_+ \vartheta \otimes \ldots \otimes \vartheta \rangle = 1$. Hence $\rho_+ = P^* (|\vartheta \otimes \ldots \otimes \vartheta\rangle \langle \vartheta \otimes \ldots \otimes \vartheta|)$, a convex integral of product states.

Theorem

Only the state $\rho_+ = \rho_{\square \square \square \square \square}$ (n boxes) is separable, all other extremal states ρ_Y on $\mathcal{Z}_{n,d}$ are entangled.

Proof.

Choose $\vartheta \in \mathbb{C}^d$. Since $\vartheta \otimes \ldots \otimes \vartheta \in \mathcal{H}_+$, we have $\langle \vartheta \otimes \ldots \otimes \vartheta, p_+ \vartheta \otimes \ldots \otimes \vartheta \rangle = 1$. Hence $\rho_+ = P^* (|\vartheta \otimes \ldots \otimes \vartheta\rangle \langle \vartheta \otimes \ldots \otimes \vartheta|)$, a convex integral of product states. Conversely, suppose that $Y \neq \square \square \square \square \square \square$ (*n* boxes), and that ρ_Y is separable:

$$ho_{Y}(a) = \sum_{i} \langle \psi_{i}, a\psi_{i} \rangle$$

Theorem

Only the state $\rho_+ = \rho_{\square\square\square\square}$ (n boxes) is separable, all other extremal states ρ_Y on $\mathcal{Z}_{n,d}$ are entangled.

Proof.

Choose $\vartheta \in \mathbb{C}^d$. Since $\vartheta \otimes \ldots \otimes \vartheta \in \mathcal{H}_+$, we have $\langle \vartheta \otimes \ldots \otimes \vartheta, p_+ \vartheta \otimes \ldots \otimes \vartheta \rangle = 1$. Hence $\rho_+ = P^*(|\vartheta \otimes \ldots \otimes \vartheta\rangle \langle \vartheta \otimes \ldots \otimes \vartheta|)$, a convex integral of product states. Conversely, suppose that $Y \neq \square \square \square \square \square$ (*n* boxes), and that ρ_Y is separable:

$$\rho_{Y}(a) = \sum_{i} \langle \psi_{i}, a\psi_{i} \rangle$$

Then $0 = \rho_Y(p_+) = \sum_i \langle \psi_i, p_+\psi_i \rangle$, i.e. $p_+\psi_i = 0$ for all *i*.

Theorem

Only the state $\rho_+ = \rho_{\square\square\square\square}$ (n boxes) is separable, all other extremal states ρ_Y on $\mathcal{Z}_{n,d}$ are entangled.

Proof.

Choose $\vartheta \in \mathbb{C}^d$. Since $\vartheta \otimes \ldots \otimes \vartheta \in \mathcal{H}_+$, we have $\langle \vartheta \otimes \ldots \otimes \vartheta, p_+ \vartheta \otimes \ldots \otimes \vartheta \rangle = 1$. Hence $\rho_+ = P^*(|\vartheta \otimes \ldots \otimes \vartheta\rangle \langle \vartheta \otimes \ldots \otimes \vartheta|)$, a convex integral of product states. Conversely, suppose that $Y \neq \square \square \square \square \square$ (*n* boxes), and that ρ_Y is separable:

$$\rho_{Y}(a) = \sum_{i} \langle \psi_{i}, a\psi_{i} \rangle$$

Then $0 = \rho_Y(p_+) = \sum_i \langle \psi_i, p_+\psi_i \rangle$, i.e. $p_+\psi_i = 0$ for all *i*. However, product vectors with this property do not exist!

Theorem

Only the state $\rho_+ = \rho_{\square \square \square \square \square}$ (n boxes) is separable, all other extremal states ρ_Y on $\mathcal{Z}_{n,d}$ are entangled.

Proof.

Choose $\vartheta \in \mathbb{C}^d$. Hence $\rho_+ = P^*(|\vartheta \otimes \ldots \otimes \vartheta\rangle \langle \vartheta \otimes \ldots \otimes \vartheta|)$, a convex integral of product states. Conversely, suppose that $Y \neq \square \square \square \square \square$ (*n* boxes), and that ρ_Y is separable:

$$\rho_{Y}(a) = \sum_{i} \langle \psi_{i}, a\psi_{i} \rangle$$

Then $0 = \rho_Y(p_+) = \sum_i \langle \psi_i, p_+\psi_i \rangle$, i.e. $p_+\psi_i = 0$ for all *i*. However, product vectors with this property do not exist! Indeed, suppose that the product vector $\psi_1 \otimes \ldots \otimes \psi_n$ is orthogonal to $p_+\mathcal{H}$.

Theorem

Only the state $\rho_+ = \rho_{\square\square\square\square}$ (n boxes) is separable, all other extremal states ρ_Y on $\mathcal{Z}_{n,d}$ are entangled.

Proof.

Choose $\vartheta \in \mathbb{C}^d$. Since $\vartheta \otimes \ldots \otimes \vartheta \in \mathcal{H}_+$, we have $\langle \vartheta \otimes \ldots \otimes \vartheta, p_+ \vartheta \otimes \ldots \otimes \vartheta \rangle = 1$. Hence $\rho_+ = P^*(|\vartheta \otimes \ldots \otimes \vartheta\rangle \langle \vartheta \otimes \ldots \otimes \vartheta|)$, a convex integral of product states. Conversely, suppose that $Y \neq \square \square \square \square \square$ (*n* boxes), and that ρ_Y is separable:

$$\rho_{Y}(a) = \sum_{i} \langle \psi_{i}, a\psi_{i} \rangle$$

Then $0 = \rho_Y(p_+) = \sum_i \langle \psi_i, p_+\psi_i \rangle$, i.e. $p_+\psi_i = 0$ for all *i*. However, product vectors with this property do not exist! Indeed, suppose that the product vector $\psi_1 \otimes \ldots \otimes \psi_n$ is orthogonal to $p_+\mathcal{H}$. Then it is orthogonal to all vectors of the form $\vartheta \otimes \ldots \otimes \vartheta$ with $\vartheta \in \mathbb{C}^d$:

$$\mathsf{0} = \langle \vartheta \otimes \ldots \otimes \vartheta, \psi_1 \otimes \ldots \otimes \psi_n \rangle = \prod_{j=1}^n \langle \vartheta, \psi_j \rangle \,. \quad \mathsf{But:} \ \bigcup_{j=1}^n \{\psi_j\}^\perp \neq \mathbb{C}^d \;,$$

the left hand side having Lebesgue measure 0.

Theorem For all separable states ρ we have

$$\rho(p_-) \leq \frac{1}{n!}$$

with equality only for the regular trace state.

Theorem For all separable states ρ we have

$$\rho(p_-) \leq \frac{1}{n!}$$

with equality only for the regular trace state.

Proof.

Theorem For all separable states ρ we have

$$\rho(p_-) \leq \frac{1}{n!}$$

with equality only for the regular trace state.

Proof.

The determinant of the Gram matrix of an *n*-tuple of unit vectors is equal to

$$egin{aligned} \mathsf{det}ig(\langle\psi_i,\psi_j
angleig) &= & \mathsf{det}ig(\sum_{k=1}^n \langle\psi_i,e_k
angle\langle e_k,\psi_j
angleig) \ &= & ig|\mathsf{det}ig(\langle\psi_i,e_k
angleig)ig|^2 = \mathsf{vol}ig(\psi_1,\psi_2,\ldots,\psi_nig)^2 \leq 1 \ ; \end{aligned}$$

Theorem For all separable states ρ we have

$$\rho(p_-) \leq \frac{1}{n!}$$

with equality only for the regular trace state.

Proof.

The determinant of the Gram matrix of an *n*-tuple of unit vectors is equal to

$$\begin{aligned} \mathsf{det}\big(\langle\psi_i,\psi_j\rangle\big) &= \mathsf{det}\big(\sum_{k=1}^n \langle\psi_i,e_k\rangle\langle e_k,\psi_j\rangle\big) \\ &= \left|\mathsf{det}\big(\langle\psi_i,e_k\rangle\big)\right|^2 = \mathsf{vol}(\psi_1,\psi_2,\ldots,\psi_n)^2 \leq 1 ;\end{aligned}$$

Hence

$$\langle \psi_1 \otimes \ldots \otimes \psi_n, p_- \psi_1 \otimes \ldots \otimes \psi_n \rangle \leq \tau_{\operatorname{reg}}(p_-) = \frac{1}{n!}$$

The Schur and Lieb inequalities

We have $2\mathcal{P}(n) - 3$ inequalities, which divide the state space $\mathcal{S}(\mathcal{Z}_n)$ into compartments, and claim the the shadow of the product states falls into one of them.

Schur's 1918 inequality states that for all separables states ρ and all Young frames $Y \neq \{-\}$:

$$\rho(p_Y) \geq d(Y)^2 \rho(p_-).$$

Lieb's 1967 conjecture hopes that for all separable ρ and all Young frames

$$Y
eq \{+\}$$
: $ho(p_Y) \leq d(Y)^2
ho(p_+)$.

The last trivial inequality says that for all separable ρ :

$$ho(p_-) \leq
ho(p_+)$$
 .

These are all Bell inequalities.

These are all Bell inequalities, but not all optimal.

These are all Bell inequalities, but not all optimal.

Our hope was, to prove that for all $n \in \mathbb{N}$ the separable completely symmetric states would form a polytope.

Our hope was, to prove that for all $n \in \mathbb{N}$ the separable completely symmetric states would form a polytope. However, this hope breaks down at n = 5:

Our hope was, to prove that for all $n \in \mathbb{N}$ the separable completely symmetric states would form a polytope. However, this hope breaks down at n = 5:

Theorem (Barrett, Hall, Loewy (1999) translated)

The set of all completely symmetric separable states on $\mathcal{B}((\mathbb{C}^d)^{\otimes 5})$ has an infinite number of extremal points.

Our hope was, to prove that for all $n \in \mathbb{N}$ the separable completely symmetric states would form a polytope. However, this hope breaks down at n = 5:

Theorem (Barrett, Hall, Loewy (1999) translated) The set of all completely symmetric separable states on $\mathcal{B}((\mathbb{C}^d)^{\otimes 5})$ has an infinite number of extremal points.

In 1999 they showed that, already in the five qubit situation, the set of separable states on the center possesses a part that is bulging outward.

The maximal tensor norm:

The maximal tensor norm: Let $\mathcal{H} := (\mathbb{C}^d)^{\otimes n}$, and let V denote the set of linear functionals on $\mathcal{B}(\mathcal{H})$ of the form

 $x \mapsto \langle \psi_1 \otimes \ldots \otimes \psi_n, x \vartheta_1 \otimes \ldots \otimes \vartheta_n \rangle$,

where $\psi_1, \psi_2, \ldots, \psi_n, \vartheta_1, \vartheta_2, \ldots, \vartheta_n$ are unit vectors in \mathbb{C}^d .

The maximal tensor norm: Let $\mathcal{H} := (\mathbb{C}^d)^{\otimes n}$, and let V denote the set of linear functionals on $\mathcal{B}(\mathcal{H})$ of the form

$$\mathbf{x} \mapsto \langle \psi_1 \otimes \ldots \otimes \psi_n, \mathbf{x} \vartheta_1 \otimes \ldots \otimes \vartheta_n \rangle$$

where $\psi_1, \psi_2, \ldots, \psi_n, \vartheta_1, \vartheta_2, \ldots, \vartheta_n$ are unit vectors in \mathbb{C}^d . Then a norm on the dual of $\mathcal{B}(\mathcal{H})$, is define by

$$\left\|\omega\right\|^{V} := \inf\left\{\left|\sum_{i=1}^{k} \lambda_{i}\right| \omega = \sum_{i=1}^{k} \lambda_{i} \nu_{i}, k \in \mathbb{N}, \lambda_{1}, \lambda_{2}, \dots, \lambda_{k} > 0, \nu_{1}, \nu_{2}, \dots, \nu_{k} \in V\right\};$$

The maximal tensor norm: Let $\mathcal{H} := (\mathbb{C}^d)^{\otimes n}$, and let V denote the set of linear functionals on $\mathcal{B}(\mathcal{H})$ of the form

$$\mathbf{x} \mapsto \langle \psi_1 \otimes \ldots \otimes \psi_n, \mathbf{x} \vartheta_1 \otimes \ldots \otimes \vartheta_n \rangle$$

where $\psi_1, \psi_2, \ldots, \psi_n, \vartheta_1, \vartheta_2, \ldots, \vartheta_n$ are unit vectors in \mathbb{C}^d . Then a norm on the dual of $\mathcal{B}(\mathcal{H})$, is define by

$$\|\omega\|^V := \inf\left\{\left.\sum_{i=1}^k \lambda_i \left| \, \omega = \sum_{i=1}^k \lambda_i
u_i \,, k \in \mathbb{N}, \lambda_1, \lambda_2, \dots, \lambda_k > 0,
u_1,
u_2, \dots,
u_k \in V
ight.
ight\}
ight\}
ight\}$$
;

When ρ is a state on $\mathcal{B}(\mathcal{H})$, we define its entanglement $E(\rho)$ by

 $E(\rho) := \left\|\rho\right\|^{V}.$

•
$$E(\rho) \ge 1$$
 for all ρ ; $E(\rho) = 1$ iff ρ is separable;

- $E(\rho) \ge 1$ for all ρ ; $E(\rho) = 1$ iff ρ is separable;
- $E((T_1 \otimes \ldots \otimes T_n)\rho) \leq E(\rho)$ for all quantum operations T_1, T_2, \ldots, T_n on $\mathcal{B}(\mathbb{C}^d)$;

- $E(\rho) \ge 1$ for all ρ ; $E(\rho) = 1$ iff ρ is separable;
- $E((T_1 \otimes \ldots \otimes T_n)\rho) \leq E(\rho)$ for all quantum operations T_1, T_2, \ldots, T_n on $\mathcal{B}(\mathbb{C}^d)$;

$$\blacktriangleright E(\rho \otimes \vartheta) \leq E(\rho) \cdot E(\vartheta).$$

The maximal tensor norm has all the required properties of an entanglement measure:

- $E(\rho) \ge 1$ for all ρ ; $E(\rho) = 1$ iff ρ is separable;
- $E((T_1 \otimes \ldots \otimes T_n)\rho) \leq E(\rho)$ for all quantum operations T_1, T_2, \ldots, T_n on $\mathcal{B}(\mathbb{C}^d)$;
- $\blacktriangleright \ E(\rho \otimes \vartheta) \leq E(\rho) \cdot E(\vartheta).$

(Here we would actually prefer equality!)

How entangled are the extremal completely symmetric states?
How entangled are the extremal completely symmetric states?

Theorem

Let $n, d \in \mathbb{N}$, and let Y denote an n-block Young frame with height $\leq d$. The entanglement of the completely symmetric state ρ_Y satisfies

$$\frac{n!}{d(Y) \cdot \operatorname{Imm}_{Y}(G(\psi_{\max}))} \leq E(\rho_{Y}) \leq \frac{\sum_{\sigma \in S_{n}} |\chi_{Y}(\sigma)|}{\operatorname{Imm}_{Y}(G(\psi_{\max}))} + \frac{1}{2} \sum_{\sigma \in S_{n}} |\chi_{Y}(\sigma)| + \frac{1}{2} \sum_{\sigma \in S_{n$$

where ψ_{max} is that n-tuple of unit vectors in \mathbb{C}^d for which $\text{Imm}_Y(G(\psi))$ is maximal.

How entangled are the extremal completely symmetric states?

Theorem

Let $n, d \in \mathbb{N}$, and let Y denote an n-block Young frame with height $\leq d$. The entanglement of the completely symmetric state ρ_Y satisfies

$$\frac{n!}{d(Y) \cdot \operatorname{Imm}_{Y}(G(\psi_{\max}))} \leq E(\rho_{Y}) \leq \frac{\sum_{\sigma \in S_{n}} |\chi_{Y}(\sigma)|}{\operatorname{Imm}_{Y}(G(\psi_{\max}))} + \frac{1}{2} \sum_{\sigma \in S_{n}} |\chi_{Y}(\sigma)| + \frac{1}{2} \sum_{\sigma \in S_{n$$

where ψ_{max} is that n-tuple of unit vectors in \mathbb{C}^d for which $\text{Imm}_Y(G(\psi))$ is maximal.

In particular, the antisymmetric state has entanglement

$$E(\rho_{-}) = n!$$
.
